

PHOTO	BUG Title	Bug Description	EXPECTED RESULT	TYPE
	Signup form fields appear prefilled before user enters any data	User may think account details are already filled Creates confusion whether form is auto-populated Password field especially looks like a real saved password Can reduce trust in signup flow	Before user input: All fields should be empty Only placeholder text should appear in a clear placeholder style Password field should not look like an already entered password	UI / UX Bug,Severity Medium
	Password field shows bullet characters before user enters any password.	"Without any user input, the signup form appears prefilled with sample data, and the password field looks like an already entered password, which creates confusion and trust issues."	Password field should remain empty or show a hint like "Enter password", not masked dots that look like an existing password.	UI / UX Bug
	Signup action triggering unrelated "Profile Data" error	User fills all fields (Name, Email, Password) Clicks "Sign up" Error message shown (bottom right): Unable to load your profile data. Please try again in a moment.	On clicking Sign up, system should: Create account successfully OR Show relevant error like: Email already exists Invalid email format Password too weak	Functional Bug (High Severity) Also can be tagged as: API Integration Bug Error Handling Bug
	Google Sign-Up fails and shows incorrect authentication timeout message	When user clicks "Sign up with Google", the system redirects to an error page showing: Authentication Error "Authentication timed out. Please try signing in again." But the browser URL contains error details like: error=server_error error_code=unexpected_failure error_description=Database error saving new user This means the actual failure is related to server/database issue, while UI is showing authentication timeout.	When user clicks "Sign up with Google": Account should be created successfully and user should be redirected to the proper dashboard/home page OR If signup fails, system should show the correct error message related to the actual issue, such as: unable to create account database error signup failed, please try again later Also, sensitive internal error details should not be exposed in the URL	Functional Bug Also can be marked as: API Integration Bug Error Handling Bug Security Bug because internal error details are visible in URL. Severity High Priority High

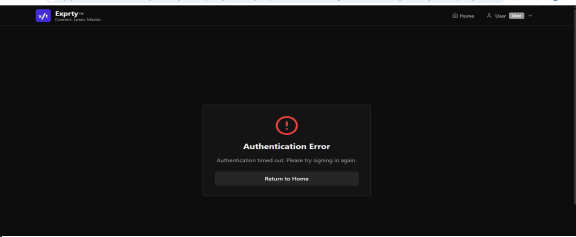

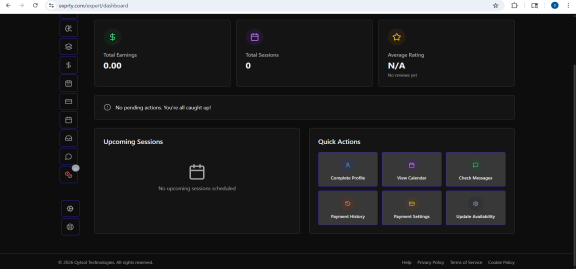

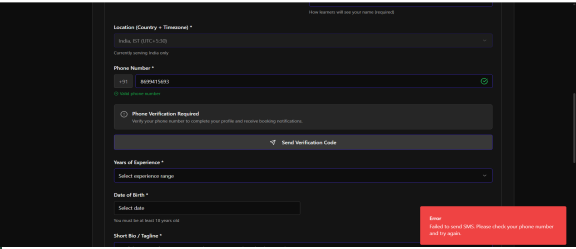

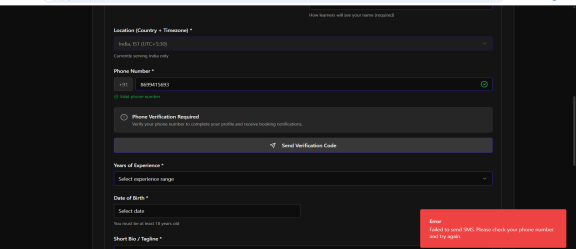

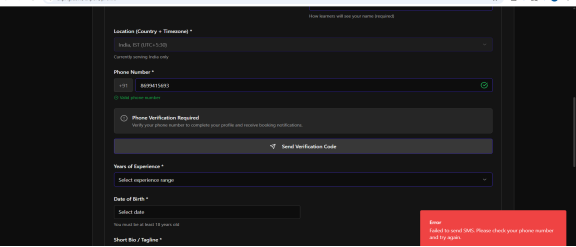

PHOTO	BUG Title	Bug Description	EXPECTED RESULT	TYPE
	Internal server error details exposed in callback URL	The URL displays technical/internal information such as: server_error unexpected_failure Database error saving new user	System should not expose internal backend or database failure details in the URL. A generic user-friendly message should be shown instead.	Security / Error Handling Bug
	Incorrect Default State – “No Pending Actions” shown even when profile is incomplete	On the dashboard, the system shows “No pending actions. You’re all caught up!”, but at the same time “Complete Profile” is visible in Quick Actions. This is logically incorrect because profile completion is still pending.	If profile is incomplete, system should show pending action like “Complete your profile” instead of “All caught up”.	Functional Bug / Logical Bug
	SMS Verification Failure despite valid number	User enters a valid phone number (✓ shown) but on clicking “Send Verification Code”, system shows error: “Failed to send SMS”. This indicates backend/API failure or integration issue.	SMS should be successfully sent to valid number OR proper error reason (like server issue).	Functional / API Bug
	Incorrect Validation vs Backend Conflict	UI shows “Valid phone number”, but backend rejects the same number during SMS sending → mismatch between frontend validation and backend validation.	Validation should be consistent between frontend and backend.	Validation Bug
	No Retry / Recovery Guidance	Error message only says “try again” but does not provide retry mechanism, cooldown timer, or support link.	System should provide retry option, limit info, or help/support guidance.	UX Bug

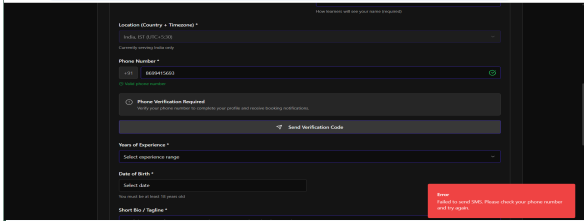

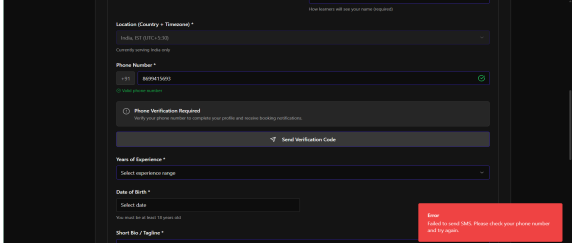

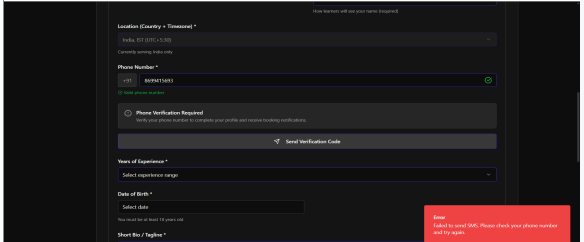

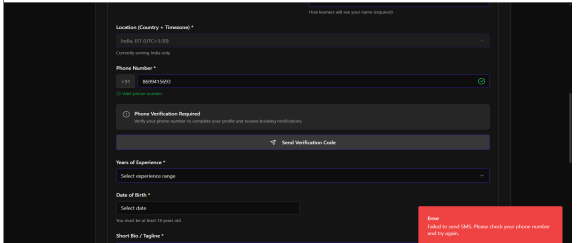

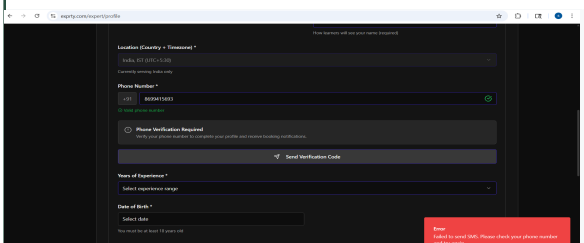

PHOTO	BUG Title	Bug Description	EXPECTED RESULT	TYPE
	Error Message Not Specific	Error is generic ("Failed to send SMS") → no reason like network issue / OTP limit reached / server down.	Show specific error message for better debugging & user clarity.	UX / Functional Bug
	Send Button Not Disabled During API Call	User can click "Send Verification Code" multiple times, which may cause multiple API hits or spam requests.	Button should be disabled or show loader until API response is received.	Performance / Functional Bug
	Missing Loader / Progress Indicator	No loading spinner after clicking send → user doesn't know if request is processing.	Show loader or progress indicator while sending OTP.	UX Bug
	Blocking Issue – Profile Completion Impossible	Phone verification is required to complete profile, but OTP is failing → user cannot proceed further.	System should allow retry or fallback method (email verification/support).	Critical / Blocker Bug
	Hardcoded Country Restriction Issue	"Currently serving India only" + +91 number used → still OTP fails → possible regional SMS gateway issue.	SMS service should support India properly if restricted to India.	Integration Bug

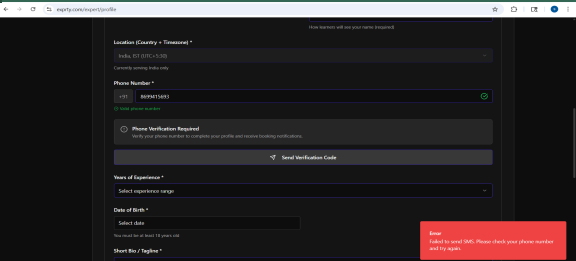

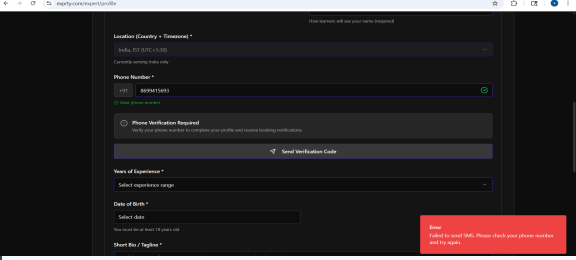

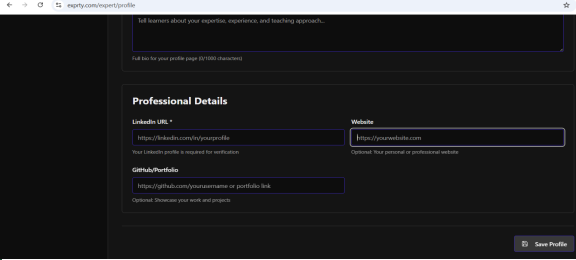

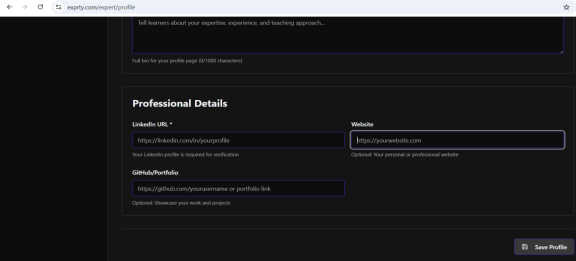

PHOTO	BUG Title	Bug Description	EXPECTED RESULT	TYPE
 A screenshot of a web browser showing a profile creation form. The form has fields for Location, Phone Number, Years of Experience, Date of Birth, and Short Bio. A red error toast message is visible in the bottom right corner, stating "Error: Failed to send SMS. Please check your phone number and try again." The toast is partially overlapping the form's content.	Error Toast UI Overlapping Content	Error popup is covering UI area (bottom-right), may block buttons or inputs.	Error message should not block important UI elements.	UI Bug
 A screenshot of the same profile creation form. A red error toast message is visible in the bottom right corner, stating "Error: Failed to send SMS. Please check your phone number and try again." The toast is partially overlapping the form's content.	No Rate Limit Message	If OTP limit exceeded, system does not inform user.	Show message like "You have exceeded OTP attempts. Try after X minutes."	Functional Bug
 A screenshot of a web browser showing a profile creation form. The form has fields for Professional Details, LinkedIn URL, Website, GitHub/Portfolio, and Short Bio. The placeholder text for the Short Bio field is "Full bio for your profile page (21000 characters)". The placeholder text for the LinkedIn URL field is "https://linkedin.com/in/yourprofile". The placeholder text for the Website field is "https://yourwebsite.com". The placeholder text for the GitHub/Portfolio field is "https://github.com/yourusername or portfolio link".	Placeholder looks like pre-filled data (UI Misleading Bug)	Input fields like Website, LinkedIn, GitHub, Short Bio show text like https://yourwebsite.com, Enter description... but they look like already filled values instead of placeholders. This confuses user into thinking data is already entered.	Placeholder text should be clearly distinguishable (light gray, faded, or floating label). Empty fields should look empty.	UI / UX Bug
 A screenshot of the same profile creation form. The "Save Profile" button is visible at the bottom right of the form, even though some mandatory fields are empty.	Save Profile Button Active Without Validation	"Save Profile" button visible even when mandatory fields are empty.	Button should be disabled until required fields are filled.	Functional Bug

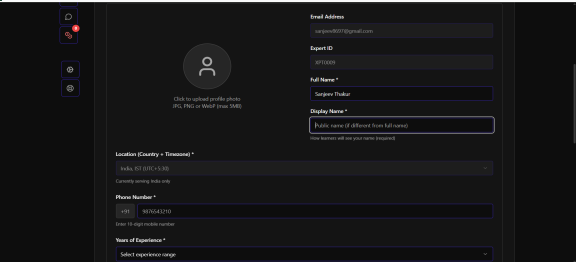

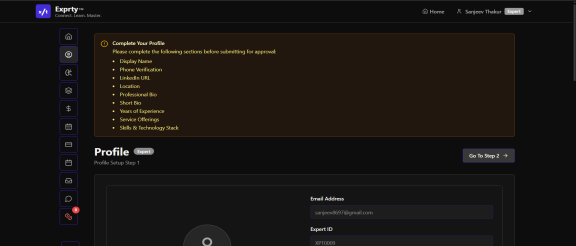

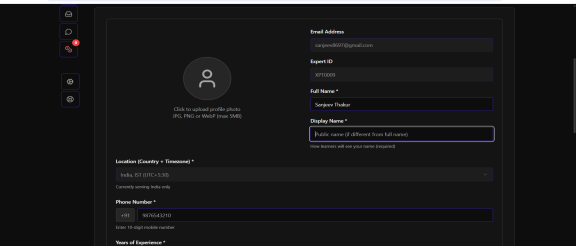

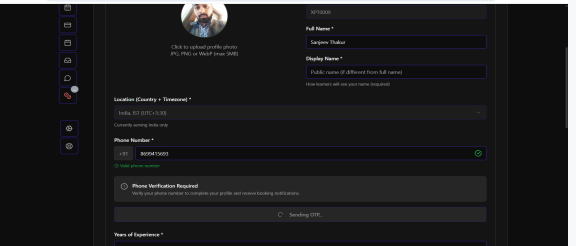

PHOTO	BUG Title	Bug Description	EXPECTED RESULT	TYPE
	Inconsistent Field Behavior	Phone number earlier showed "Valid" but later plain input without validation state.	Consistent validation UI across all fields.	UI Consistency Bug
	Step Navigation Without Completion	"Go To Step 2" button visible even when Step 1 incomplete.	Restrict navigation until Step 1 is completed.	Functional Bug
	Poor Placeholder Contrast (Accessibility Issue)	Placeholder text color is too strong --> looks like real text.	Use lighter color for accessibility clarity.	Accessibility Bug
	Infinite Loader – OTP Sending Not Completing	After clicking "Send Verification Code", button shows "Sending OTP.." with loader but no success or failure response is shown. System is stuck in loading state.	System should show success (OTP sent) or error message within few seconds. Loader should not run indefinitely.	Critical Functional / API Bug

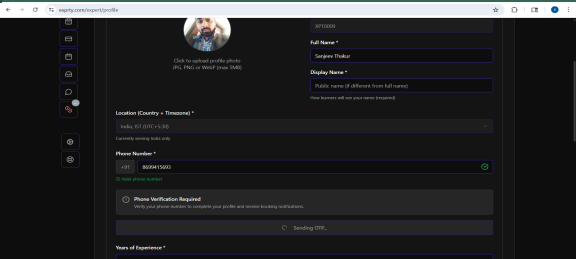

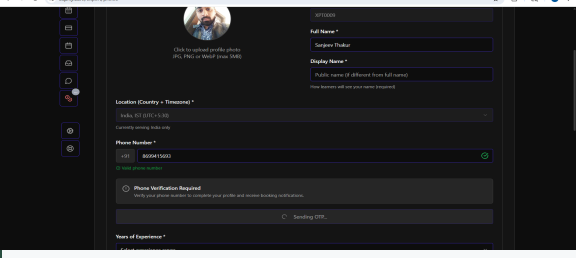

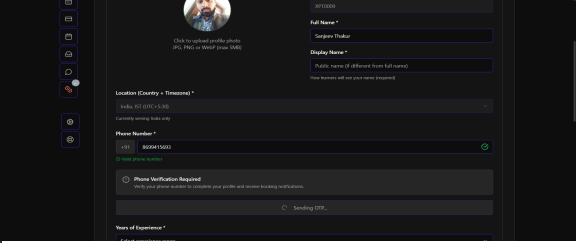

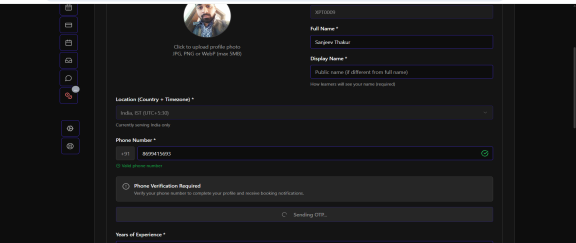

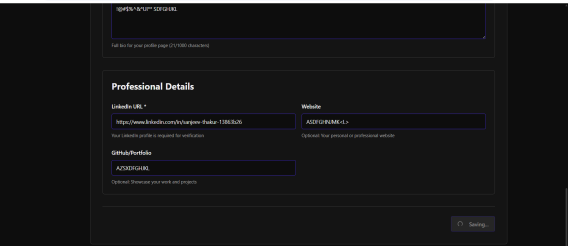

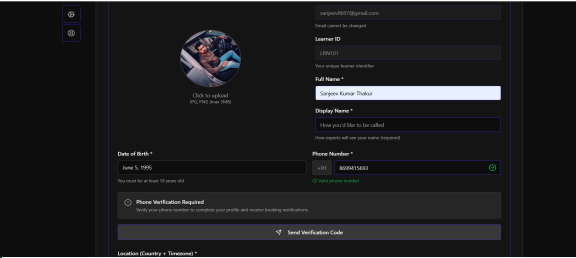

PHOTO	BUG Title	Bug Description	EXPECTED RESULT	TYPE
	Button Not Reset After API Call	"Sending OTP." button remains disabled and never returns to normal state.	Button should revert back after response.	Functional Bug
	No Timeout Handling	System does not handle timeout if API takes too long.	Show timeout error like "Request timed out. Try again."	Functional Bug
	No Error Message Display	Earlier error toast not visible now → user does not know what happened.	Show proper error or success message.	UX Bug
	No Retry Option	User cannot retry easily since button is stuck.	Provide retry button or auto reset.	UX Bug

PHOTO	BUG Title	Bug Description	EXPECTED RESULT	TYPE
	Infinite "Saving..." State – Form Not Submitting	After clicking "Save Profile", button shows "Saving..." with loader, but process never completes (no success or error). System is stuck.	System should save data and show success message OR error within few seconds.	Critical Functional / API Bug
	Phone Verification Bypass Issue	User is able to proceed to the next stage/profile completion without completing phone verification, even though "Phone Verification Required" message is clearly shown on the screen. This breaks the validation flow and allows unverified users to continue.	User should NOT be allowed to proceed until phone number is verified successfully using OTP. "Send Verification Code" must be completed before moving forward.	Functional / Security Bug
